

FILLING DEVICE HAVING LATERAL FILLING WINDOWS

ABSTRACT

A filling device for a writing instrument has a reservoir positioned in a housing (for a refillable liquid. A wick-like section of a writing tip exposed on one end of the housing projects into this reservoir. A filling spout for the liquid is able to be attached to the other end of the housing. A movable dosing cap is provided on the filling spout in order to expose at least one filling opening for supplying the liquid before reaching an end position of the dosing cap.
